

#### ASME ORC 2013

2<sup>nd</sup> International Seminar on ORC Power Systems

October 7th & 8th, 2013 De Doelen, Rotterdam, The Netherlands

#### CONCEPT OF THE GEO-BIO MICRO POWER PLANT

Władysław Kryłłowicz, DSc, PhD, TUL Prof. Dorota Piotrowska, PhD Łukasz Antczak, MSc

Lodz University of Technology, Institute of Turbomachinery www.p.lodz.pl www.imp.p.lodz.pl

#### Localisation of the polish existing geothermal facilites

## Geothermal conditions in Uniejów

**Discovered in 1978** 

Run in 2001

Temperature of water at the production well [°C]: 67-70

Lower Cretaceous sandstone at a depth of [m] 2000

Mineralization [g/l]: 6,8-8,8

Mass flow rate: 33.3 kg/s (120m3/h)

![](_page_5_Picture_0.jpeg)

# Identified problems...

- Considerable diffrences in heat consumption in summer and winter – this means a lack of utilization of available geothermal resources in case of a traditional power plant.
- Lack of the geothermal water consumption in summer creates a danger of the flow blockage

#### Why a geothermal power plant?

![](_page_6_Figure_1.jpeg)

![](_page_7_Picture_0.jpeg)

# Concept of the full utilization of energy from geothermal waters

![](_page_7_Figure_2.jpeg)

![](_page_8_Picture_0.jpeg)

### Low temperature heat sources?

- Q: What if the energy source is water of the temperature 100°C (for e.g. geothermal water, waste heat)?
- **Ans:** Using water in the cycle is problematic due to low pressure, low density of the steam and low cycle efficiency.
- Solution: Organic Rankine Cycle (ORC)

## Concept of the "geo-bio" hybrid power plant

![](_page_9_Figure_2.jpeg)

![](_page_10_Picture_0.jpeg)

# Schematic view of the "geo-bio" hybrid power plant (Version "A")

![](_page_10_Figure_2.jpeg)

![](_page_11_Picture_0.jpeg)

# Schematic view of the "geo-bio" hybrid power plant (Version "B")

![](_page_11_Figure_2.jpeg)

#### Scheme of the experimental stand

![](_page_12_Figure_1.jpeg)

#### **Experimental stand**

![](_page_13_Figure_1.jpeg)

A test stand : 1-steam boiler, 2-condenser, 3-water tank, 4-steam turbine, 5-eddy curent brake, 6condenser/evaporator, 7- HFE 7100 tank, 8-ORC turbine, 9-condenser ORC, 10-fuel tank, 11- pump, 12- ORC pump, 13-resistance heater

![](_page_14_Picture_0.jpeg)

### Steam turbine - general view

![](_page_14_Picture_3.jpeg)

![](_page_14_Picture_4.jpeg)

![](_page_14_Picture_5.jpeg)

# Mach number distribution in the steam turbine blading system

![](_page_15_Figure_1.jpeg)

![](_page_16_Picture_0.jpeg)

#### ORC turbine - general view

![](_page_16_Picture_3.jpeg)

![](_page_16_Figure_4.jpeg)

# Streamlines distribution in the ORC blading system

![](_page_17_Figure_1.jpeg)

# Mach number distribution in the ORC blading system

![](_page_18_Figure_1.jpeg)

![](_page_19_Picture_0.jpeg)

#### Power in function of effciency of the ORC turbogenerator

![](_page_19_Figure_2.jpeg)

![](_page_20_Picture_0.jpeg)

# Effciency of the micro power plant in function of effciency of the ORC turbogenerator

![](_page_20_Figure_2.jpeg)

![](_page_21_Picture_0.jpeg)

#### Electric power in function of generator speed

![](_page_21_Figure_2.jpeg)

Prędkość obrotowa generatora [obr/min]

![](_page_22_Picture_0.jpeg)

# **Ecological effects**

The quantities of pollution emissions to atmosphere are reduced by replacing the power and heat generation based on the coal-fired power plant by a geo-hybrid power plant with similar output:

- dust and ash: 95 tons
- CO2 approx. 18950 tons/year
- SO2: 13.8 tons/year
- NOx: 4.8 tons/year

![](_page_22_Figure_8.jpeg)

## See you in Uniejow 🙂

![](_page_23_Picture_1.jpeg)
